

QUESTION TWO - How have your qualifications and studies helped you prepare for this course or subject?

For research for a cystic fibrosis project, I critically appraised conflicting sources, developing my ability to evaluate validity. This is crucial in patient consultation for ensuring evidence-based practice, leading to delivery of accurate information to patients. While creating a powerpoint for this, I asked questions to students, enabling collaborative discussion and peer-led learning. This is mirrored in medical education, where transfer of information from the past experience of the teacher to the learner can deepen understanding, reflecting the NHS value of working together for patients. When helping a dyslexic student, I adapted my teaching by using visual aids and allowing extra time. This experience taught me the importance of tailoring information to individual needs, like doctors do with patients and colleagues to encourage shared decision-making. I completed an e-learning course on medical ethics and the NHS Constitution, which deepened my understanding of its principles and how they guide care. In addition to this, I completed a first aid course where I learnt how to respond to emergencies like burns, increasing my competency under pressure. This commitment to life-long learning was reflected in my work experience, linking theory to practice. Doctors must stay up to date with new guidelines to make informed decisions, while also being proficient in translating these guidelines to patients in a hectic environment.
